

### 材料清單:

- 1.紅外線接收器x1
- 2.紅外線發射器x1
- 3.蜂鳴器x1
- 4. 溫濕度感測器x1
- 5.水位感測器x1
- 6.LED燈泡x1
- 7.電阻x1
- 8.杜邦線20條
- 9.ardunio開發板x2
- 10.麵包板x1
- 11.Wi-Fi傳輸模組x1
- 12.遙控器x1

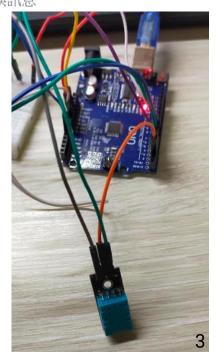

## 智慧遙控器感測流程

#### 溫溼度感測器

設定溫度>=29或<=26以開啟或關閉冷氣,採用SimpleDHT.h函式庫

```
if ((err = dht11.read(pinDHT11, &temperature, &humidity, NULL)) != SimpleDHTErrSuccess) { //溫溼度水位感測
   Serial.print("Read DHT11 failed, err="); Serial.println(err); //讀取失敗列出錯誤訊息
   delay(1000);
   return;
if (int(temperature)>=29 || int(humidity)>=68 ) {
     IrSender.sendNEC(0xfFE01F7,32); //開冷氣0xfFE01F7,紅外線發射器/接收器時再行說明
else if(int(temperature) <= 27) {</pre>
  IrSender.sendNEC(0xB91E116F, 32); //關冷氣0xB91E116F
```

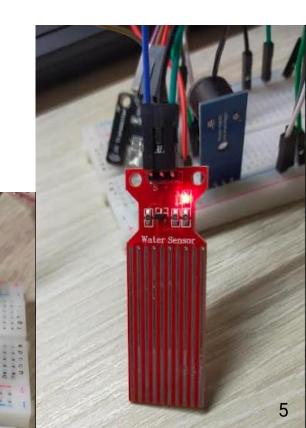

#### 水位感測器&蜂鳴器

設定水位大於0.5cm關閉冷氣,大於2cm開啟蜂鳴器,同樣採用SimpleDHT.h函式庫

```
if ((err = dht11.read(pinDHT11, &temperature, &humidity, NULL)) != SimpleDHTErrSuccess) { //溫溼度水位咸測
   Serial.print("Read DHT11 failed, err="); Serial.println(err); //讀取失敗列出錯誤訊息
  delay(1000);
  return;
if(water val < 280)</pre>
 Serial.println(" | dry"); //水位不足表示為乾
else if(water val < 510)</pre>
 Serial.println(" | water level: ~ 0-0.5 cm"); //不同水位顯示對應訊息,此為0~0.5cm
else if(water val < 570)</pre>
 Serial.println(" | water level: ~ 0.5-1 cm"); //約0.5~1cm
else if(water val < 630)</pre>
 Serial.println(" | water level: ~ 1-1.5 cm"); //約1~1.5cm
else if(water val < 690)</pre>
 Serial.println(" | water level: ~ 1.5-2 cm"); //約1.5~2cm
else
 Serial.println(" | water level: over 2 cm"); //大於2cm
```

```
if(water_val>=500 && water_val <690{
    IrSender.sendNEC(0xB91E116F,32); //關冷氣0xB91E116F
}
else if( water_val>=690) {
    digitalWrite(buzzPin, LOW);//有源蜂鳴器響起
    IrSender.sendNEC(0xB91E116F,32); //關冷氣0xB91E116F
}
else{
    digitalWrite(buzzPin, HIGH); //有源蜂鳴器關閉
```

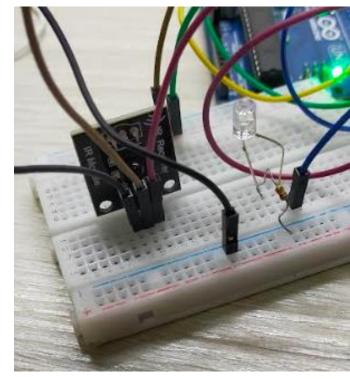

#### 紅外線接收器

紅外線接收器和發送器皆透過IRremote.h函式庫使用,首先是接收部分,用來模擬接收來自發送端的紅外線訊號,使冷氣接收並開關冷氣

```
#include <IRremote.h>
int light=5;
int RECV PIN = 6; //訊號接收角位
IRrecv irrecv(RECV PIN);
decode results results;
void setup() {
  Serial.begin(9600);
  irrecv.enableIRIn();
  irrecv.blink13(true);
 pinMode(RECV PIN, INPUT);
 pinMode(light, OUTPUT); //控制LED,方便辨識是否接收訊號
  Serial.println("IR remote Initial completed");
```

```
void loop(){
 if (irrecv.decode(&results)) { //接收訊點就顯示訊息!
       Serial.print("results value in HEX is ");
       Serial.println(results.value, HEX);
       irrecv.resume();
 if(results.value == 0xFFE01F7A){ //若接收到指定訊號則開顯示冷氣開機訊息
       Serial.println("Turn On!");
       digitalWrite(5, HIGH);
       delay(100);
       digitalWrite(5, LOW); //亮暗一次表開機
  else if(results.value == 0xB91E116F){ //若接收到指定訊號則顯示冷氣關閉訊息
       Serial.println("Turn down!");
       digitalWrite(5, HIGH);
       delay(100);
       digitalWrite(5, LOW);
       delay(100);
       digitalWrite(5, HIGH);
       delay(100);
       digitalWrite(5, LOW);
       delay(100);
                           - //亮暗爾坎表閣機
```

### 紅外線訊號編碼

紅外線接收器部分程式內的紅外線編碼為模擬方便所示,是先用遙控器按特定鍵讓接收端接收,並顯示在螢幕上求得,實際上不能直接使用,需再以其他方式拆解分析該訊號,排除其他訊號造成的誤差,得最終訊號才能使用

紅外線16進制碼:0x30000066600000C(62位元) 關
3612 -2316 584 -604 632 -1752 648 -1724 652 -1732 656 -540 652 -548 632 紅外線16進制碼:0x30000076600000E(62位元) 開
3612 -2308 640 -556 632 -552 648 -1736 656 -1736 648 -540 632 -556 660 紅外線16進制碼:0x30000066600000C(62位元) 關
3612 -2288 656 -556 620 -1764 656 -1732 652 -1724 648 -556 664 -520 648 紅外線16進制碼:0x30000076600000E(62位元) 開
3592 -2300 644 -552 644 -556 624 -1752 648 -1736 632 -556 648 -540 640

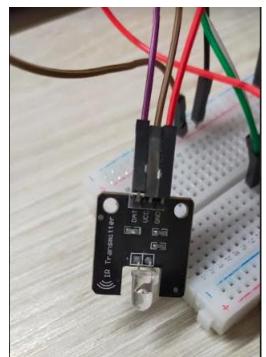

#### 紅外線發射器

訊號發送部分,用以模擬發送端發射紅外線訊號給接收端,同樣使用IRremote.h函式庫,發射角Ardunio UNO統一採用角位3,此表示依需求發射對應訊號

```
#define PIN_SEND 3

void setup() {
    Serial.begin(9600);
    IrSender.begin(PIN_SEND);
}
if(int(temperature)>=29 || int(humidity)>=68 ){

    IrSender.sendNEC(0xFFE01F7,32); //開冷氣0xFFE01F7,紅外線發射器/接收器時再行說明
}
else if(int(temperature)<=27){
    IrSender.sendNEC(0xB91E116F,32); //關冷氣0xB91E116F
}
```

### Wi-Fi模組

用Ardunio通用之Wi-Fi模組,資料觀測網站選用thingspeak,需包含SoftwareSerial.h函式庫

```
#include < Software Serial.h >
#define RX 4 // TX of esp8266 in connected with Arduino pin 2
#define TX 5 // RX of esp8266 in connected with Arduino pin 3
String WIFI SSID = "1";// WIFI NAME
String WIFI PASS = "12345678"; // WIFI PASSWORD
String API = "K8ZRGMIMOTMXPOZX";// Write API KEY
String HOST = "api.thingspeak.com";
String PORT = "80";
int countTrueCommand;
int countTimeCommand;
boolean found = false;
SoftwareSerial esp8266(RX,TX);
```

```
void setup() {
  Serial.begin (9600);
  esp8266.begin(115200);
  esp8266.write("AT+UART DEF=9600,8,1,0,0\r\n");
  delay(1500);
  esp8266.begin (9600);
  sendCommand("AT",5,"OK"); //顯示Wi-fi等資訊是否成功連線
  sendCommand("AT+CWMODE=1",5,"OK");
  sendCommand("AT+CWJAP=\""+ WIFI SSID +"\",\""+ WIFI PASS +"\"",20,"OK");
void loop() {
String getData="GET /update?api key="+ API+"&field5="+water val+"&field6="+(int)temperature +"&field7="+(int)humidity;
//+"&field2="+hum +"&field3="+light;
 sendCommand("AT+CIPMUX=1",5,"OK");
 sendCommand("AT+CIPSTART=0,\"TCP\",\""+ HOST +"\","+ PORT,15,"OK");
 sendCommand("AT+CIPSEND=0," +String(getData.length()+4),4,">");
esp8266.println(getData);
delay(500);
 countTrueCommand++;
 sendCommand("AT+CIPCLOSE=0",5,"OK");
count++;
```

```
if(esp8266.find(readReplay))//ok
    found = true;
    break;
  countTimeCommand++;
if(found == true)
  Serial.println("OK");
  countTrueCommand++;
  countTimeCommand = 0;
if(found == false)
  Serial.println("Fail");
  countTrueCommand = 0;
  countTimeCommand = 0;
found = false;
                                                                                                                    12
```

void sendCommand(String command, int maxTime, char readReplay[]) {

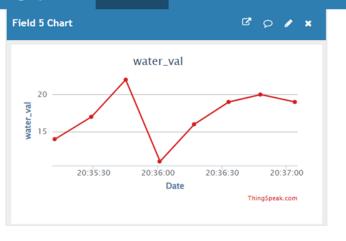

Serial.print (countTrueCommand);
Serial.print(". at command => ");

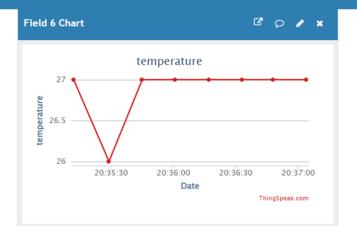

while(countTimeCommand < (maxTime\*1))</pre>

esp8266.println(command);//at+cipsend

Serial.print(command);
Serial.print(" ");

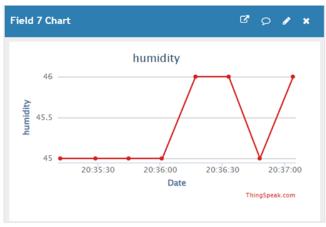

Commercial Use

How to Buy

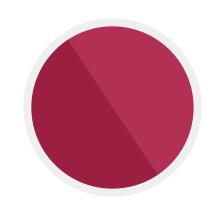

### 展望&預期效果

會想做智慧冷氣遙控器的發想為冷氣漏水,以及每**6**小時會自動關閉,和電費過高等問題,希望透過定時或智慧感測來開關冷氣,降低電量浪費和滴水問題。。

希望未來可以實現除開關功能外,也能開啟冷氣的特定模式(除濕),以及升降溫等功能,另外如果在外上課時,可以先用thingspeak來監控溫度,並用手機的app來遠端預先開啟冷氣,
